DRAFT  
VERSION

Assess **Vital Signs**, ABC's and responsiveness, **Oxygen** PRN

- Hyperflex mother's hips (knees pressed firmly to patient's chest) by first provider.
- Second provider apply suprapubic (not fundal) pressure with fist directed downwards.
- Third provider provide gentle downward traction on fetal head.  
*(McRobert's Maneuver)*

Transport immediately.  
Communicate concern for "shoulder dystocia" in ring down.

ALS

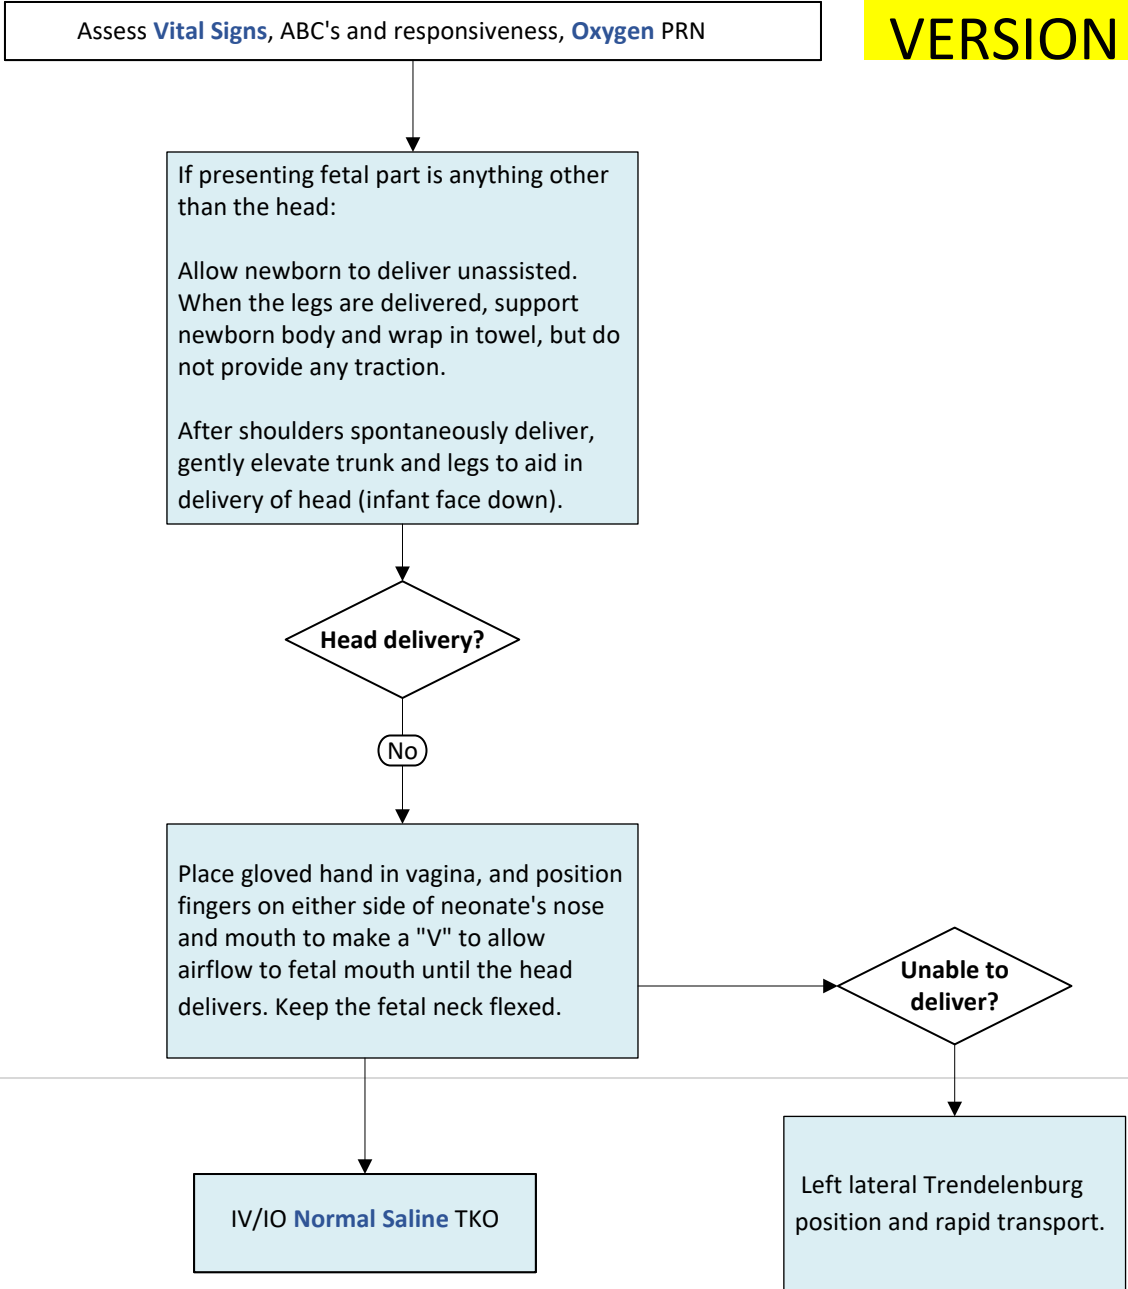

IV/IO **Normal Saline** TKO

  
Report any incident of suspected domestic violence to emergency department staff

- Comments**
- Shoulder dystocia is when the fetal shoulder becomes wedged behind the pubic bone.
  - Clinically, fetal head noted to retract back after progressing forward known as the "turtle sign."

Effective: xxxxxx  
Supersedes: NEW

**DRAFT  
VERSION**

ALS

Report any incident of suspected domestic violence to emergency department staff

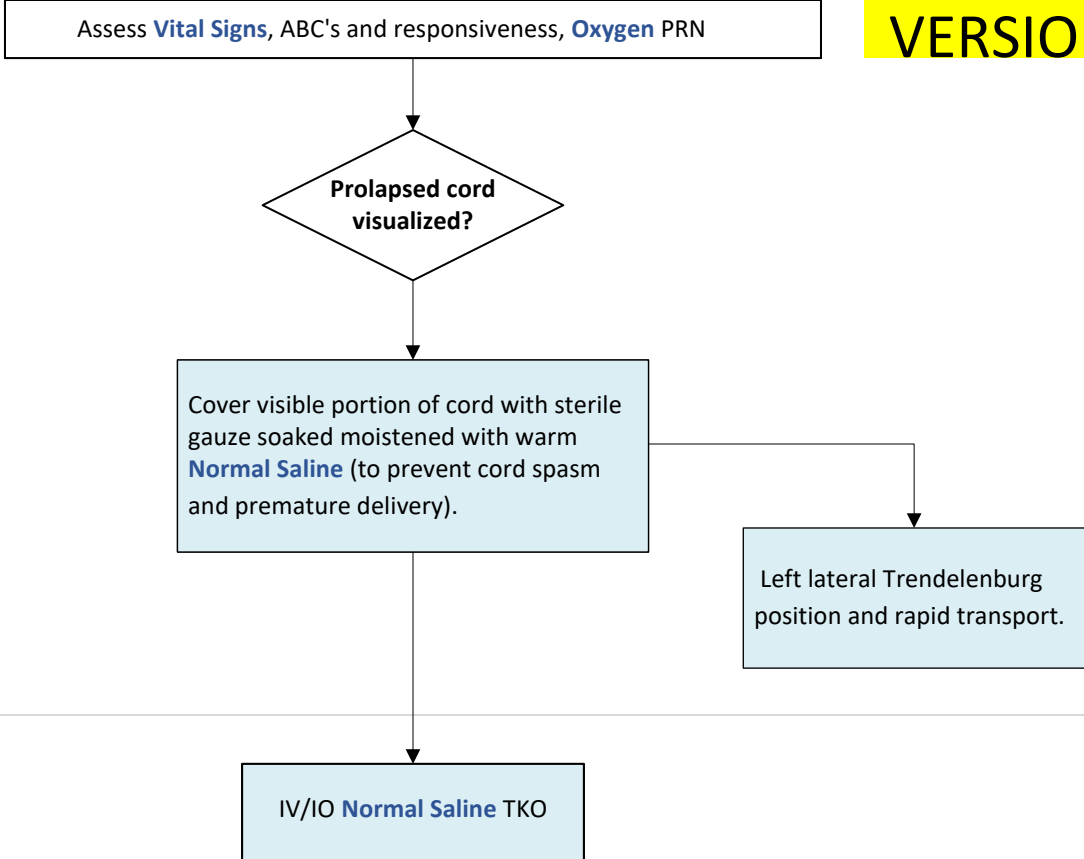

**Comments**

- Not all breech presentations can be delivered vaginally, quick transport for potential surgical intervention is critical.
- Allowing spontaneous delivery of fetus up to level of umbilicus increases cervical dilation, decreasing risk of fetal head entrapment.

Effective: xxxxxx  
Supersedes: NEW

**DRAFT  
VERSION**

ALS

IV/IO Normal Saline TKO

**Comments**

- Gently displace presenting part of fetus off cord and maintain displacement to achieve pulsatile cord blood flow.
- DO NOT pull or over-handle cord in order to prevent cord compression and spasm.
- Do NOT reposition or switch providers maintaining displacement. If provider, such as midwife, has already displaced fetus off cord they should maintain position and transport with patient.

## 5.04 Childbirth: Complications – Public Comment April 2024

### Nuchal Cord

#### BLS Treatment

- Once fetal head is delivered, check for the presence of a cord around fetal neck.
- If nuchal cord noted, hook finger between nuchal cord and fetal body and attempt to reduce by slipping cord over head.
- If multiple nuchal cord loops are noted, reduce one at a time.
- If unable to reduce, deliver fetus with nuchal cord around neck.

### Shoulder Dystocia

#### BLS Treatment

- Instruct mother to stop pushing immediately.
- Perform McRobert's Maneuver: Hyperflex mother's hips (knees pressed firmly to patient's chest) by first provider with second provider applying suprapubic (not fundal) pressure with fist directed downwards with third provider providing gentle downward traction on fetal head.
- Transport should be initiated immediately with communication of concern for "shoulder dystocia" in ring down report.

#### Comments

- Shoulder dystocia is when the fetal shoulder becomes wedged behind the pubic bone
- Clinically, fetal head noted to retract back after progressing forward known as the "turtle sign".

### Breech Delivery

#### BLS Treatment

If presenting fetal part is anything other than head:

If baby is delivering (not head):

- Allow newborn to deliver unassisted. When the legs are delivered, support newborn body and wrap in towel, but do not provide any traction. After shoulders spontaneously deliver, gently elevate trunk and legs to aid in delivery of head (infant face down).
- ~~If unable to deliver, left lateral Trendelenburg position and rapid transport.~~
- If head does not deliver with next contraction, place gloved hand in vagina, and position fingers on either side of the neonate's nose and mouth to make a "V" to allow airflow to
