Subject: 301 Mission Retrofit Monitoring Report 091: Results as of January 31, 2023

CONTEXT

This memorandum summarizes results from the monitoring plan implemented at the 301 Mission property. Instrumentation to monitor the structure prior to, during and after the retrofit was installed in January 2021, including piezometers and extensometers. Settlement markers installed in April 2009 and January 2017, survey prisms mounted on the exterior of the structure in December 2016, and crack gauges installed in April 2009 have also been monitored. Pile load cells were installed on the Mission Street piles in January 2023. Survey markers were installed on the Mission Street mat extension in January 2023. This memorandum is for review only. It only contains ongoing monitoring information. This memorandum does not contain recommendations based upon the ongoing monitoring information.

PRESENTATION OF DATA

Figure 01 presents the instrument locations as referenced in later figures.

Figure 02 presents the historical settlement data interpreted from settlement markers installed on the B-1 Level of 301 Mission Tower. In addition, data from surveys performed during the retrofit are included. Figure 03A presents settlement data since the start of production pile installation (May 12, 2021; baseline readings on May 10, 2021) through January 30, 2023. Figure 03B presents settlement data since January 11, 2021, through January 30, 2023. Figure 03C presents settlement data during the First Stage Load Transfer for a subset of the settlement markers and the mat extension survey points from January 23, 2023, through January 27, 2023. Figure 04 presents current settlement contours (in inches) on January 31, 2023.

Figure 05 presents historical lateral roof deflections in the project north-south and project east-west directions interpreted from survey prisms mounted on the exterior of the Tower, from InSAR data, and from a planar fit of the settlement marker data. In addition, data from surveys performed during the retrofit are included. Figure 06A presents lateral roof deflection data from a planar fit of the settlement marker data and from survey prisms mounted on the exterior of the Tower since the start of production pile installation (May 12, 2021; baseline readings on May 10 and 13, 2021, respectively) through January 31, 2023. Figure 06B presents lateral roof deflection data from a planar fit of the settlement marker data and from survey prisms mounted on the exterior of the Tower since January 11, 2021, through January 31, 2023.

Figure 07 presents the historical groundwater elevation interpreted from piezometer readings at locations near 301 Mission. In addition, data from piezometers installed to monitor groundwater elevation during the retrofit are included. Figures 08 and 09 present groundwater elevation interpreted from piezometer readings

in the Marine/Colma Sand and the Old Bay Clay, respectively, for the time period prior to the start of production pile installation (January 1, 2021) through January 31, 2023.

Figure 10 presents extensometer data from within the Tower basement since the start of production pile installation (May 12, 2021) through January 30, 2023. Figure 11 presents extensometer data from Fremont Street since the start of production pile installation (May 12, 2021) through January 31, 2023. Figure 12 presents extensometer data from Mission Street since the start of production pile installation (May 12, 2021) through January 31, 2023.

Figure 13 presents pile load cell data since the start of the First Stage Load Transfer (January 23, 2023) through January 31, 2023.

CLOSING

Note that one of the Mission Street piezometers, PB-2, has been offline since October 3, 2022. One of the Fremont Street extensometers, EB-1, has been offline since November 30, 2022. First Stage Load Transfer on Mission St., consisting of loading PPU piles 30, 31, 32, 33, 35 and 36 to 500 kips in 100-kip increments occurred between January 23, 2023, and January 27, 2023. The mat extension survey points were measured with an approximately 25-foot-long survey rod spanning from the top of the mat extension to above grade. Please contact us if you have any comments or questions, or if you would like to discuss the results presented in this memorandum.

Mat extension survey points (V, VI) measured with an approximately 25-foot-long survey rod.

Exact times are approximate; surveys occurred at most four hours before (AM readings) or after (PM readings) daily load application.
