Subject: 301 Mission Retrofit Monitoring Report 116: Results as of July 24, 2023

---

## CONTEXT

This memorandum summarizes results from the monitoring plan implemented at the 301 Mission property. Instrumentation to monitor the structure prior to, during and after the retrofit was installed in January 2021, including piezometers and extensometers. Settlement markers installed in April 2009 and January 2017, survey prisms mounted on the exterior of the structure in December 2016, and crack gauges installed in April 2009 have also been monitored. Pile load cells were installed on the Mission Street piles in January 2023. Survey markers were installed on the Mission Street mat extension in January 2023, prior to the Stage 1 load transfer and on the Fremont Street mat extensions in June 2023, prior to the Stages 2 and 3 load transfer. This memorandum is for review only. It only contains ongoing monitoring information. This memorandum does not contain recommendations based upon the ongoing monitoring information.

## PRESENTATION OF DATA

Figure 01 presents the instrument locations as referenced in later figures.

Figure 02 presents the historical settlement data interpreted from settlement markers installed on the B-1 Level of 301 Mission Tower. In addition, data from surveys performed during the retrofit are included. Figure 03A presents settlement data since the start of production pile installation (May 12, 2021; baseline readings on May 10, 2021) through July 24, 2023. Figure 03B presents settlement data since January 11, 2021, through July 24, 2023. Figure 04 presents current settlement contours (in inches) on July 24, 2023.

Figure 05 presents historical lateral roof deflections in the project north-south and project east-west directions interpreted from survey prisms mounted on the exterior of the Tower, from InSAR data, and from a planar fit of the settlement marker data. In addition, data from surveys performed during the retrofit are included. Figure 06A presents lateral roof deflection data from a planar fit of the settlement marker data and from survey prisms mounted on the exterior of the Tower since the start of production pile installation (May 12, 2021; baseline readings on May 10 and 13, 2021, respectively) through July 24, 2023. Figure 06B presents lateral roof deflection data from a planar fit of the settlement marker data and from survey prisms mounted on the exterior of the Tower since January 11, 2021, through July 24, 2023.

Figure 07 presents the historical groundwater elevation interpreted from piezometer readings at locations near 301 Mission. In addition, data from piezometers installed to monitor groundwater elevation during the retrofit are included. Figures 08 and 09 present groundwater elevation interpreted from piezometer readings in the Marine/Colma Sand and the Old Bay Clay, respectively, for the time period prior to the start of production pile installation (January 1, 2021) through July 24, 2023.

Figure 10 presents extensometer data from within the Tower basement since the start of production pile installation (May 12, 2021) through July 24, 2023. Figure 11 presents extensometer data from Fremont Street since the start of production pile installation (May 12, 2021) through May 16, 2023, and from the restart after fixing the extensometer (May 30, 2023) through July 14, 2023. Figure 12 presents extensometer data from Mission Street since the start of production pile installation (May 12, 2021) through July 10, 2023.

Figure 13 presents pile load cell data since the start of the First Stage Load Transfer (January 23, 2023) through July 24, 2023.

## CLOSING

Note that one of the Mission Street piezometers, PB-2, has been offline since October 3, 2022. The Mission Street instrument cables were routed through the vault and are currently disconnected until safe access can be established. The Fremont Street instrument cables were routed through the vault and are currently disconnected until safe access can be established. Four of the Fremont Street load cells have been offline since July 21, 2023; work to correct this is ongoing. Please contact us if you have any comments or questions, or if you would like to discuss the results presented in this memorandum.
