Suggested Citation

San Francisco Department of Public Health. San Francisco Sexually Transmitted Disease Annual Summary, 2015. San Francisco Department of Public Health, San Francisco, California. April 2017.

Note on data for previous years

Numbers in this document listed for past years may not match totals in previous reports. Totals may increase due to late reports, and may decrease when duplicate reports are eliminated or cases are subsequently identified as out of our jurisdiction.

In addition, disease rates may have changed due to updated denominator data from the U.S. Census Department.

Technical Note

All graphs, tables and maps in this report were produced using SAS for Windows version 9.3. The document itself was created with *Microsoft Word*.

Preface

Abbreviations used in this report include the following:

BRP	Behavioral Risk Population
SFHN.....	San Francisco Health Network (formerly "Community Health Network" in this report)
CC/CBO	Community Clinic/Community-Based Organization
CHPY	Community Health Programs for Youth
CT.....	Chlamydia
GC	Gonorrhea
IDU	Injecting drug user
MSM	Men who have sex with men
MSW.....	Men who have sex with women
OMI.....	Oceanview, Merced, Ingleside
OOJ.....	Out of jurisdiction
P&S	Primary and secondary (syphilis)
PMD	Private medical doctor
SFGH	San Francisco General Hospital

I. Reported Morbidity

Sources of data

Title 17 of the California Administrative Code requires all clinicians treating or knowing of a patient with a suspected or documented reportable sexually transmitted disease (STD) and all laboratories with a test result or isolate suggesting infection by a reportable agent of an STD to report their findings to the patient's local health department. In 2015 the list of reportable STDs included syphilis of any stage, gonorrhea, chlamydia, chancroid, pelvic inflammatory disease (PID), and non-gonococcal urethritis (NGU). Reports of morbidity must include the patient's name and address and demographic information (gender, age, and race or ethnicity). As recommended by the United States Centers for Disease Control and Prevention (CDC), gender of sex partners is a required reportable item in San Francisco, effective July 2004.

Previous reviews of the San Francisco STD surveillance system suggest that reporting is nearly complete for syphilis, gonorrhea and chlamydia when a diagnostic test was performed in a laboratory. However, many individuals with STDs are never diagnosed with a laboratory-based test, either because they do not develop symptoms, are not screened appropriately by their provider, or have no access to health care. Furthermore, demographic data are often missing from reports; in 2015, approximately 18 percent of all gonorrhea and chlamydia reports lacked information on race or ethnicity. For these reasons, reported totals should be considered minimal estimates of the true number of STDs in the community.

Disease rates

Rates have been listed in most tables along with reporting totals. Rates are equal to the number of STD cases within the specified population per 100,000 San Francisco residents in that population per year.

Rates should be used when comparing STD levels among different populations, as differences in disease totals are affected by the size of the population as well as incidence.

Comparison rates for other areas are from *Sexually Transmitted Disease Surveillance, 2014*, by the Centers for Disease Control and Prevention, US Department of Health and Human Services (November, 2015). In these figures, "San Francisco MSA" represents data for the entire San Francisco-Oakland-Hayward MSA.

Reporting sources

The two clinics mentioned most frequently in this report are City Clinic and Magnet Clinic at Strut. The San Francisco City Clinic is the only municipal STD clinic in San Francisco, operated by the San Francisco Department of Public Health (SFDPH). Much more information about City Clinic is presented in Section III below.

Supported in part by the SFDPH, Magnet is an innovative health promotion center in the Castro District of San Francisco that provides a variety of clinical and social services to address the individual sexual health needs of gay, bisexual and other MSM in San Francisco and throughout the Bay Area.

New to this year's report is the "Research" category for health care provider. We have grouped STDs identified through research projects involving San Francisco residents separately when analyzing morbidity by health care provider as they are not identified as part of routine screening or testing.

Census data

Population denominators for disease rates are based on 2010 US Census Data, except for congenital syphilis, where live birth totals for each year (reported by the SFDPH Office of Vital Records) are used instead.

Data on race or ethnicity of STD patients are typically reported as a single value, with "Hispanic" or "Latino" as a category exclusive of all others. However, in the 2000 and 2010 US Census surveys, race was collected as a multiple-choice item, with Hispanic ethnicity recorded independently of race. In order to make denominators from the census data match totals from case reports, totals for residents reporting more than one race in the census data were divided among totals for residents indicating only one race. Failure to do so would have artificially increased all race-specific rates because there are no patients recorded as "multi-racial" among the STD case reports.

Data for graphics

All numbers presented in the graphics are included in the Appendix at the end or in tables at the end of the section for the graphic.

Summary

- Reported early syphilis continued to increase in San Francisco – 1205 early syphilis cases were reported in 2015, an increase of 10.2 percent over 2014. This is the highest syphilis total since 1984.
 - Only 29 early syphilis cases were reported among women. There was one congenital syphilis case in San Francisco in 2015, the first since 2009.
 - Increases in neurosyphilis cases followed trends seen nationally; there were 13 confirmed, 2 probable, and 4 suspected cases in San Francisco in 2015.
- Gonorrhea and chlamydia cases have increased each of the last five years.
 - The 21.3 percent increase in chlamydia cases was higher between 2014 and 2015 than annual comparisons in recent years; however, the rate of increase for gonorrhea cases between 2014 and 2015 was similar, 30.4 percent, to the previous annual increase.
 - In adolescents and young adults (ages 15 to 25 years), chlamydia case rates increased for the second year in a row after a period of decline from 2010-2013. Chlamydia case rates increased by 12.0 percent in the last year, from 1883.2 to 2109.8 cases per 100,000. Gonorrhea and syphilis rates continued the increasing trend among this young group.
 - Racial/ethnic disparities for chlamydia and gonorrhea remain large for adolescents/young adults. In 2015, the rate of chlamydia among African-American adolescents/young adults was 4.5 times that of white adolescents/young adults. The rate of gonorrhea among African-American adolescents/young adults was 3.4 times that of white adolescents/young adults. The chlamydia rate for African-American adolescents/young adults has decreased by 28.4 percent since 2011, whereas the gonorrhea rate increased between 2011 and 2015 by 25.7 percent.
- Gay and bisexual men and other men who have sex with men have the highest prevalences of gonorrhea, chlamydia, and early syphilis. Transgender residents also have higher rates of STD than San Francisco residents as a whole.

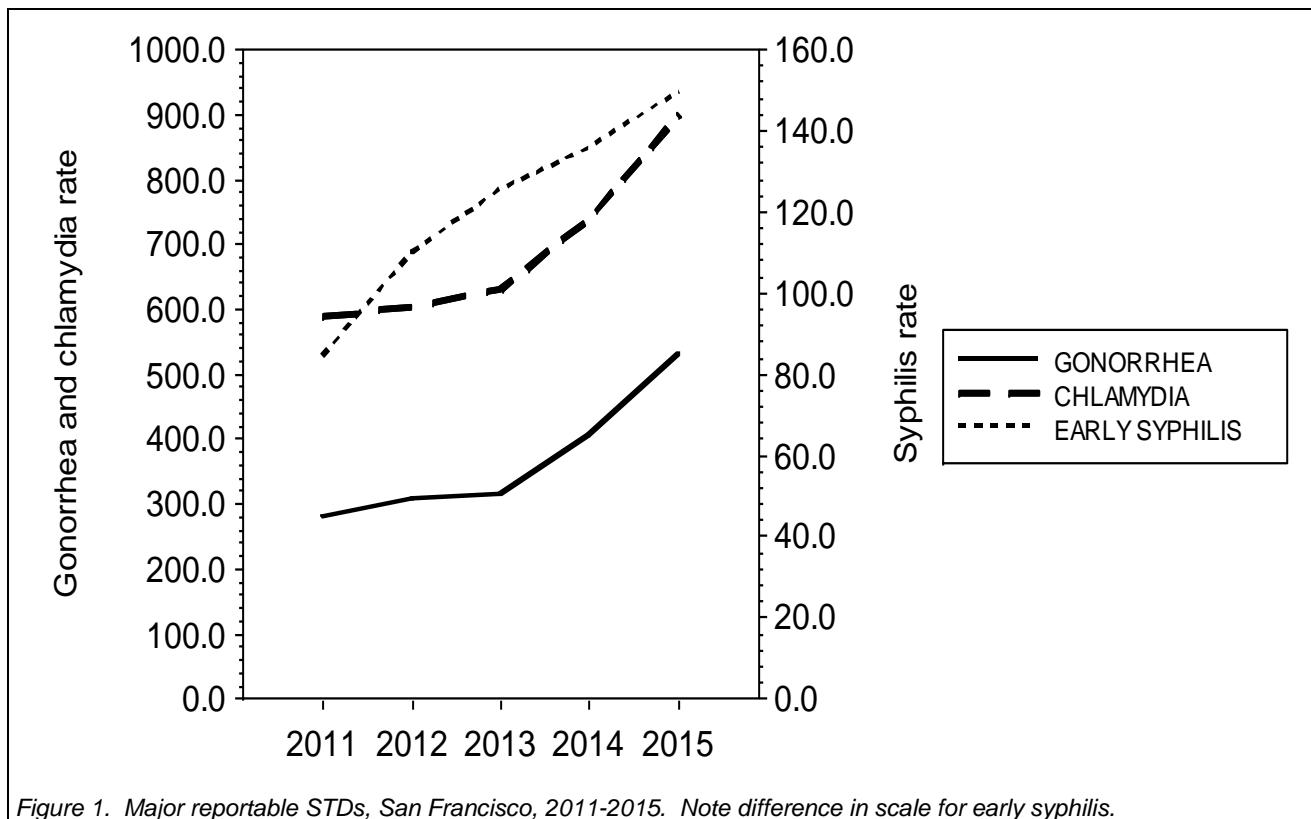

Figure 1. Major reportable STDs, San Francisco, 2011-2015. Note difference in scale for early syphilis.

Table 1. Reportable STD cases and rates, San Francisco, 2011-2015. Rates equal cases per 100,000 residents per year, except for non-gonococcal urethritis (NGU) (rates equal cases per 100,000 men), pelvic inflammatory disease (PID) (cases per 100,000 women), and congenital syphilis (cases per 100,000 live births). Note: no cases of Granuloma inguinale or tertiary (late symptomatic) syphilis have been reported since 1992.

¹ cases not known to be less than one year's duration where the patient is 40 years old or less and the initial titer is 1:32 or higher.

² PID cases meeting CDC case definition.

Chlamydia

- There were 7,241 cases of chlamydia reported among San Francisco residents in 2015; the rate was 899.2 cases per 100,000 residents per year.
- Chlamydia cases have increased in 19 of the past 21 years, and in 2015 the total was over 7000 cases for the first time.
- Cases increased dramatically from 2014 totals, both for males (4867 cases) and females (2354 cases), though the increase in male cases (29.8 percent) was greater than the increase in female cases (6.9 percent). (See “Gender” section below.)
- Private hospitals and clinics diagnosed more chlamydia in 2015 than in past years. San Francisco City Clinic accounted for only 12.2 percent of the reported chlamydia diagnoses.
- The chlamydia rate for the San Francisco MSA was slightly lower than those for Los Angeles MSA, New York MSA, the state of California and the United States in 2014. (2015 MSA rates were not yet available at the time of this publication.)

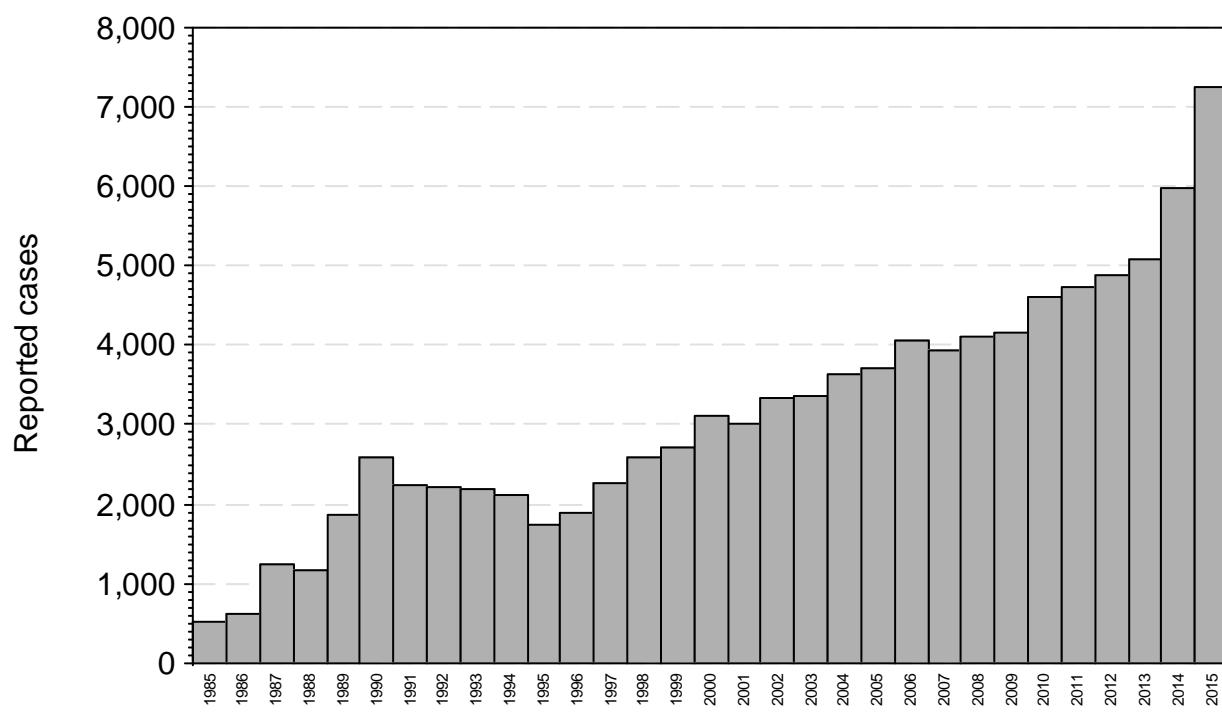

Figure 2. Reported chlamydia cases, San Francisco, 1985-2015. Note: chlamydia became a reportable disease in 1989; the Public Health Laboratory implemented nucleic acid amplification testing in Fall 1996.

Gonorrhea

- There were 4,266 cases of gonorrhea reported among San Francisco residents in 2015; the rate was 529.8 cases per 100,000 residents per year.
- Gonorrhea cases increased 30 percent in 2015 over the previous year. This was the sixth year cases have increased, though the total is well below the peak of 18,640 cases in 1979.
- Compared to 2014, rates of gonorrhea increased by 33.8 percent among males in 2015. (See “Gender” section below.)
- San Francisco City Clinic diagnosed 18.5 percent of all reported gonorrhea cases. Magnet continues to report the most cases from any clinic (1079 cases), while increases were seen in diagnoses made by hospitals (42.5 percent over 2014).
- In 2014 the gonorrhea rate for the San Francisco MSA exceeded those for the Los Angeles MSA, the New York MSA, the state of California and the United States as a whole. (2015 MSA rates were not yet available at the time of this publication.)

Syphilis

- There were 1205 cases of early syphilis reported among San Francisco residents in 2015; the rate was 149.6 cases per 100,000 residents per year. Of these, 491 were primary and secondary cases, for a P&S rate of 61.0.
- Early syphilis cases increased 10.2 percent over the previous year, due to a 11.0 percent increase in the number of early latent cases and a 28.4 percent increase in primary cases.
- Only 29 of the 1205 early syphilis cases were diagnosed in females. Syphilis in San Francisco remains a disease predominantly among men who have sex with men.
- A concerning increase in neurosyphilis cases mirrored increases seen in California and across the U.S. In San Francisco, there were 19 neurosyphilis cases reported in 2015, as compared to 14 in 2014.
- Due to missing information on case reports and the inability to interview all early latent syphilis cases in San Francisco, in 2015 a higher proportion of early syphilis cases among men are lacking information about the gender of their sex partners (14.4 percent in 2014 compared to 15.1 percent in 2015).
- More early syphilis cases were found among patients testing at Magnet (229) or at PMDs and other private clinics (171), combined, than were found among City Clinic patients (248).
- Early syphilis rates and P&S rates in the San Francisco MSA exceeded those for the Los Angeles MSA, the New York MSA, the state of California and the United States as a whole in 2014. (2015 MSA rates were not yet available at the time of this publication.)

Congenital syphilis

- One congenital syphilis case (8.3/100,000 live births) was found in San Francisco in 2015. The last previously reported congenital syphilis case was in 2009, which is before the beginning of the five-year range used in this report for most tables and graphics.

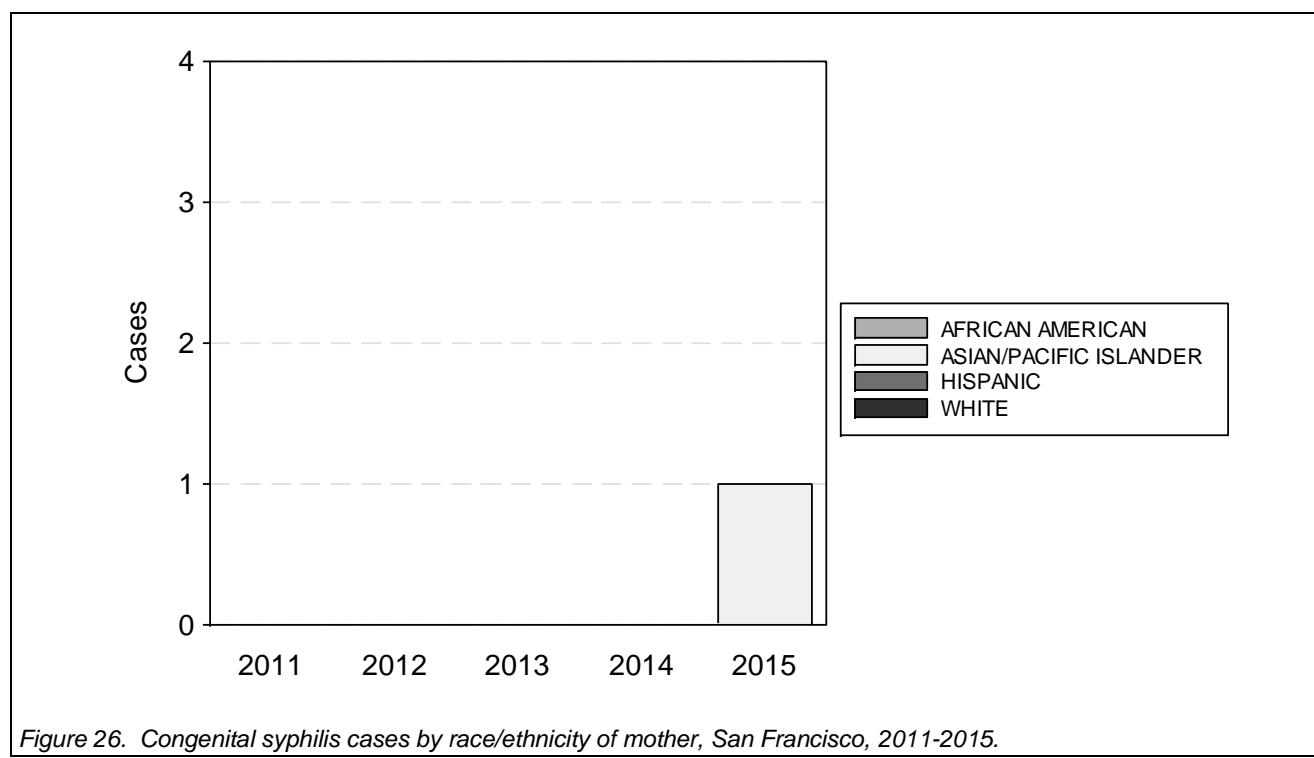

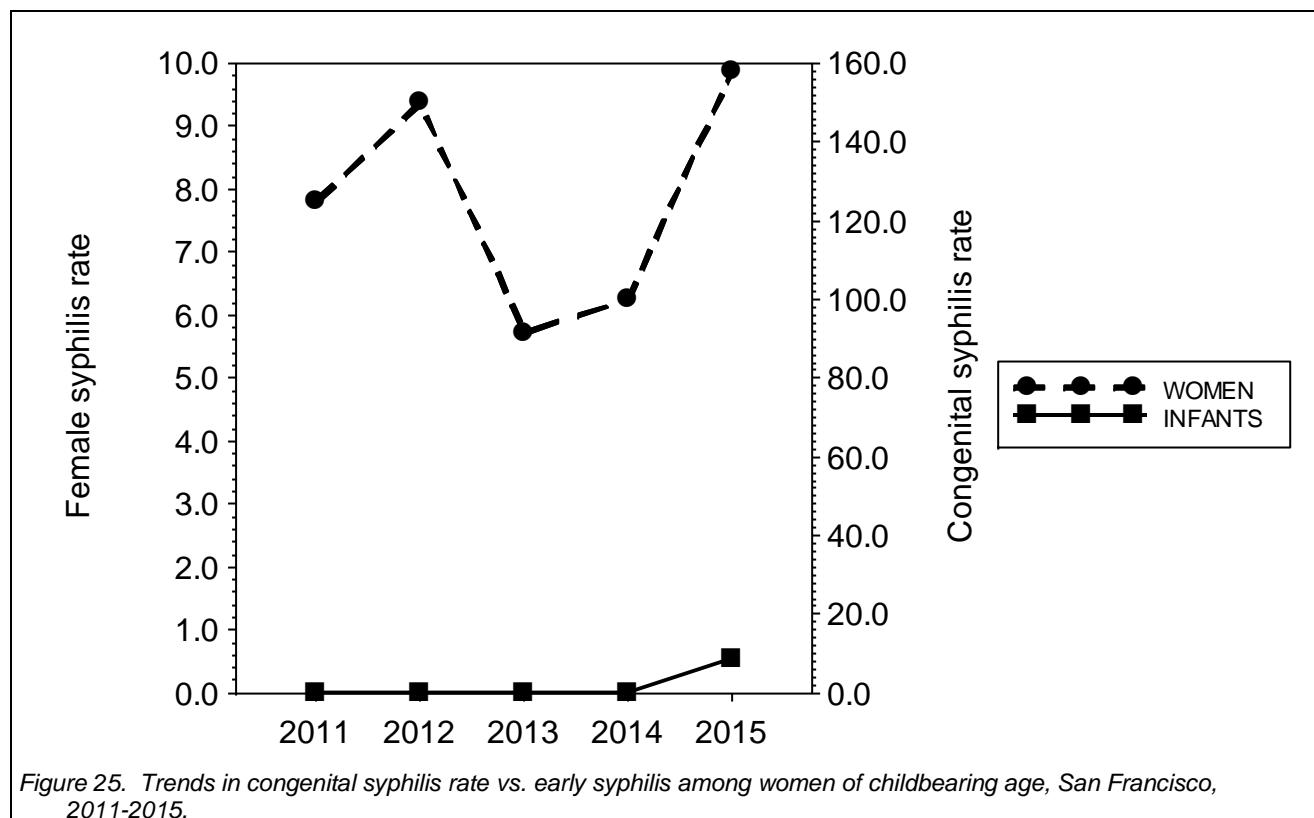

Table 9. Congenital syphilis cases and rates by race/ethnicity of mother, San Francisco, 2011-2015. Rates equal cases per 100,000 live births per year.

Diagnosis is CONGENITAL SYPHILIS

Gender

- Chlamydia rates among males remain higher than rates among females in San Francisco. The high rate of chlamydia among men in San Francisco is largely due to the prevalence of rectal and pharyngeal infections among men who have sex with men (see Figure 110). As noted above, the 2015 increase in male cases (29.8 percent) over the previous year was greater than the increase in female cases (6.9 percent).
- The gonorrhea rate among males in 2015 was 9.9 times the rate for females, an increase from last year. The gonorrhea rates in San Francisco are largely driven by a high burden of disease among men who have sex with men. As noted above, gonorrhea increased 33.8 percent among males, but remained relatively steady among females with an increase of 1.9 percent.
- Reported early syphilis cases in San Francisco in 2015 were 97.5 percent male, with 76.5 percent among gay/bi men.

Race and ethnicity

- Rates of reported STDs vary substantially by race/ethnicity, with African Americans disproportionately affected by chlamydia and gonorrhea.
- However, the disparity in chlamydia rates between African-American residents and white residents has decreased substantially over the past six years. African Americans were 5.6 times more likely to have chlamydia than whites in 2009, but only 2.0 times more likely in 2015. The disparity in gonorrhea rates is lower in 2015 (1.86) than in 2009 (2.81).
- Increases in chlamydia case rates in 2015 were due to increases across most races; the greatest increases were among Native Americans (71.4 percent) and whites (29.0 percent). Rates among African Americans however decreased slightly (6.7 percent). In contrast, gonorrhea rates increased most for Asian/Pacific Islanders (64.3 percent), Hispanics (28.9 percent), and whites (24.4%).
 - Please note that the number of cases reported among Native Americans is low and their population size is small; therefore, rates are less stable for Native Americans than for other race/ethnicity groups.
- Early syphilis rates increased by nearly 30% for both African Americans and Hispanics.

Age

- Rates of STDs continued to be highly age-dependent and varied by gender in 2015.
- Rates of chlamydia increased across all age groups, highest among the 20-24 and 25-29 year age groups. Steady decreases had been seen in the rate of chlamydia among residents 15 to 19 years of age but increased in 2015 by 10.4%.
- There were some decreases in rates by age group among females and males. Chlamydia rates for females were highest for those aged 20 to 24 years and for males aged 25 to 29.
- Gonorrhea in San Francisco affected primarily young to middle-aged adult men who have sex with men. The age distribution for males peaked among those aged 25 to 29 (40.9 percent), with the highest rates seen between ages 20 to 39. For females, gonorrhea rates were highest among residents 20 to 24 years of age.
- Early syphilis rates peaked among 45-54-year-old males, consistent with prior years, with increases among most age groups except for 35-39 year-olds (4.9% decrease) and 40-44 year-olds (29.7% decrease).

Geography

gonorrhea and chlamydia reports were missing addresses. Cases that were missing addresses or were otherwise unable to be assigned to a neighborhood are not included in these geographic analyses, but are counted as San Francisco morbidity and included in all other citywide analyses. Cases among homeless patients were also excluded. Note that the rate obtained from combining the rates for each neighborhood will therefore be lower than the actual overall rate for the city.

- High rates of chlamydia continue to be concentrated in two sectors of San Francisco: the southeastern sector and the area surrounding the Castro District. Rates for females are highest in most all of the neighborhoods in the southeast, while male rates are highest in the Castro/East Twin Peaks, Haight, Duboce Triangle/Upper Market, Mission Dolores, and SoMA neighborhoods. This distribution reflects the two overlapping chlamydia epidemics occurring among adolescents of color (southeastern sector of the city) and men who have sex with men (Castro area).
- Gonorrhea rates in San Francisco in 2015 were highest in the Castro/East Twin Peaks and Duboce Triangle/Upper Market with both having a rate in excess of 1,900 cases per 100,000 residents.
- Syphilis continues to concentrate in the Castro/East Twin Peaks, Duboce Triangle/Upper Market, and Mission Dolores neighborhoods.
- Homeless residents account for less than three percent of total reported STD morbidity.

Note on maps on following pages: Each map has four ranges of rates. The four ranges are divided by the median, 75th percentile, and 90th percentile of rates for all neighborhoods rounded down to the nearest hundredth. For each map, therefore, the neighborhoods in the lowest range are in the bottom half of rates, while the highest are the top ten percent.

¹ Neighborhoods were redefined starting with the 2012 Annual Summary. While most remained the same as in the prior reports, some were expanded and others were divided into new neighborhoods. This should be noted when comparing results in this section to geography analyses in annual summaries from before 2012.

Addresses of cases were grouped into 44 neighborhoods (see Figure 50). Neighborhoods were defined using groups of census tracts that were contiguous on sociodemographic data from the 2010 census and matched to the traditional definitions used by neighborhood residents as much as possible.¹

The census tract for each address was determined from computer geocoding. Some addresses were vague or not recognized as valid San Francisco addresses, and therefore could not be assigned to a neighborhood.

Although the law requires addresses to be included in STD reports, they are often missing. In 2015, approximately 12 percent of all

Adolescents and Young Adults (persons ages 15 through 25)

- The chlamydia rate for youth (defined as adolescents and young adults ages 15 to 25 years of age) was 2.6 times the rate among adults 26 years of age and older in 2015. The youth rate compared to the adult rate was also higher for gonorrhea but less so with a ratio of 1.4. Syphilis remains very uncommon in youth (approximately 0.5 times the rate among adults) but increased by 15.7 percent from 2014 to 2015.
- Chlamydia, gonorrhea, and syphilis rates all increased from the previous year for youth. Chlamydia rates increased by 12.0 percent from 2014, rising for the second year in a row after a 4 year period of decline. Since 2011, rates of gonorrhea have increased by 71.1 percent and syphilis rates have increased by 106 percent.
- Rates for male youth increased for both chlamydia (19.3 percent) and gonorrhea (34.4 percent). The chlamydia rate increased for female youth (by 6.8 percent), but decreased by 15.0 percent for gonorrhea.
- Racial/ethnic disparities for chlamydia and gonorrhea are large for youth. In 2015, the rate of chlamydia among African-American youth was 4.5 times that of white youth. The rate of gonorrhea among African-American youth was 3.4 times that of white youth.
- Rates decreased for both chlamydia (7.4 percent) and gonorrhea (15.8 percent) between 2014 and 2015 among African-American youth, while chlamydia and gonorrhea rates for all other youth ethnicities increased.
- Chlamydia and gonorrhea rates among youth in 2015 were high in the southeastern neighborhoods (West Hunter's Point, Bayview, and Sunnydale) and in neighborhoods with public housing projects (Potrero Hill, Mission Dolores, Western Addition). These neighborhoods have consistently had the highest rates of youth STDs. High rates for youth are also seen in Castro/East Twin Peaks and Duboce/Upper Market- gonorrhea rates in these two areas are far higher than anywhere else in the city.
- The majority of chlamydia and gonorrhea youth cases were reported by private doctors and hospitals. In 2015, among youth, a higher proportion of chlamydia cases was diagnosed by these providers (63.3 percent) compared to gonorrhea (42.4 percent).

Rectal and pharyngeal infections in men

Rectal and pharyngeal screening for gonorrhea and chlamydia for men who have sex with men began in 2003 and has expanded beyond City Clinic to local providers serving MSM populations. As a result, increases in case detection may be a function of increased screening for these often asymptomatic infections. Nearly all rectal and pharyngeal specimens collected were tested for both chlamydia and gonorrhea.

- In 2015, reports of rectal chlamydia and rectal gonorrhea continued to increase.
- Among male and transgender residents, approximately 55 percent of rectal chlamydia and gonorrhea male cases were among whites.
 - Compared to 2014, increases were seen in 2015 across all age groups for both chlamydia and gonorrhea cases.
 - As a proportion of all cases, though, there was an increase only among 15-19 year-olds and 25-29 year-olds for chlamydia, but across all age groups for gonorrhea except 20-24 and 30-34 year-olds.
- In 2015, approximately 23 percent of rectal chlamydia and gonorrhea cases were diagnosed in private medical clinics or hospitals. City Clinic and Magnet diagnosed approximately two-thirds of rectal chlamydia and gonorrhea in 2015.

Other STDs

- Note: Non-gonococcal urethritis (NGU) and pelvic inflammatory disease (PID) are not listed on the Confidentiality Morbidity Report form. Furthermore, these reports are based on clinical diagnoses, not laboratory testing. These data should be considered underestimates.
- Cases of non-gonococcal urethritis decreased slightly from 825 in 2014 to 821 in 2015. Nearly 80% of NGU cases were reported from City Clinic.
- Reported PID cases decreased by 34.1 percent, from 110 cases in 2014 to 82 in 2015.
- LGV cases increased from 9 cases in 2014 to 20 cases in 2015. Since the local LGV case definition is specific to a test performed only at the DPH lab, it is unknown whether this represents a city-wide trend.

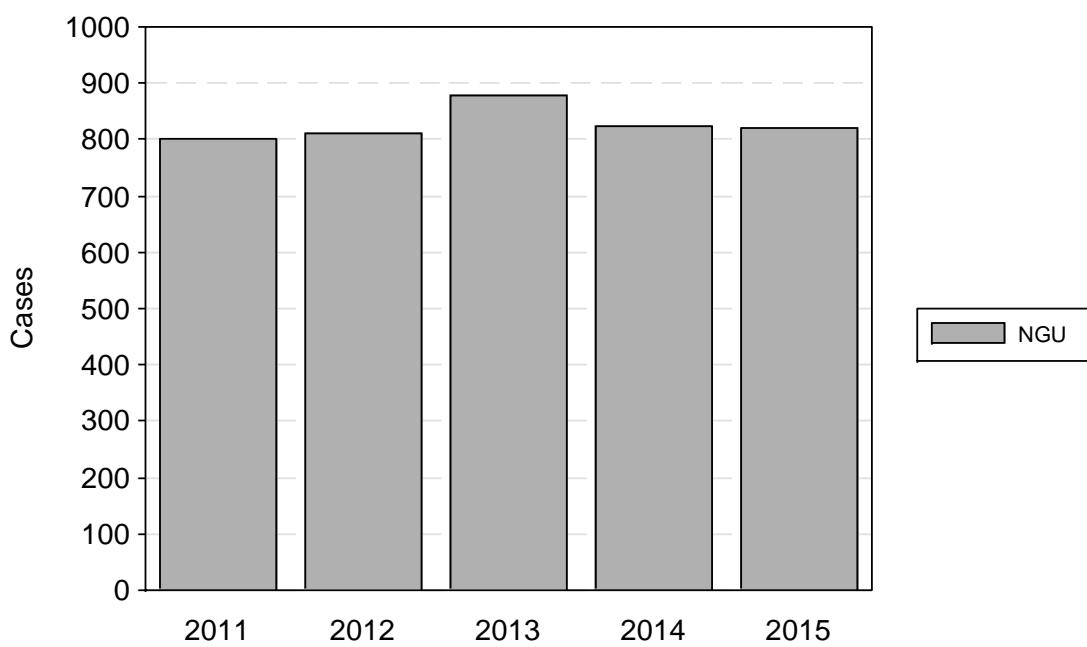

Figure 111. Reported non-gonococcal urethritis cases, San Francisco, 2011-2015.

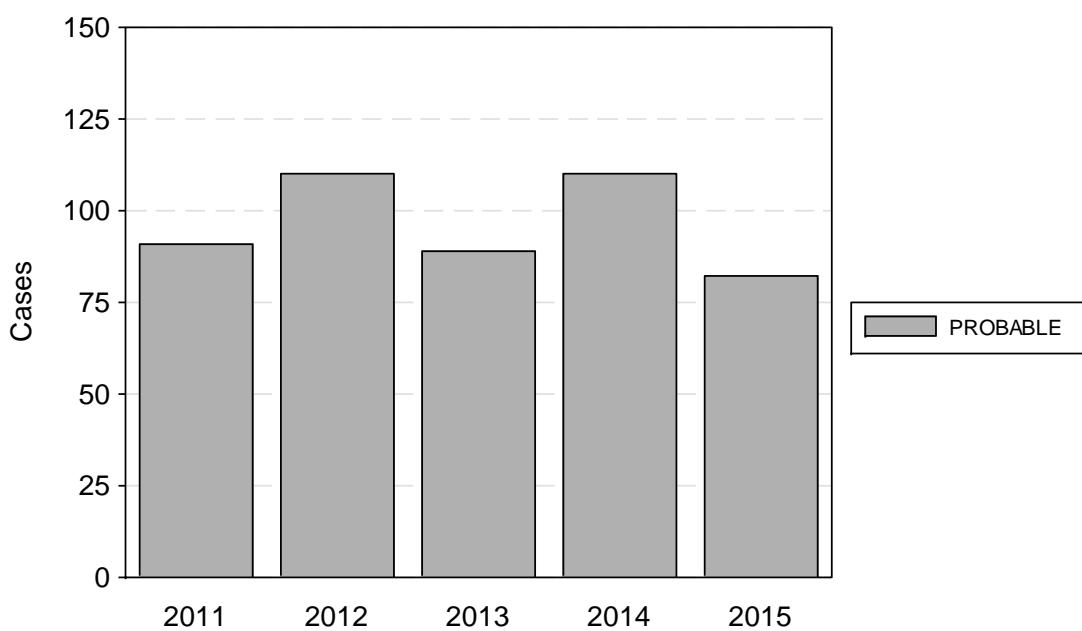

Figure 112. Reported pelvic inflammatory disease cases, San Francisco, 2011-2015. Only cases meeting CDC case definition for PID are included.

II. City Clinic

The San Francisco City Clinic is the only municipal STD clinic in San Francisco, and provides confidential, state-of-the-art sexual health services to patients twelve years of age or older. The clinic is open five days a week for 36 hours (see City Clinic website www.sfcityclinic.org for exact hours). Visits are primarily drop-in, though appointments are available to patients returning for follow-up tests or treatments.

The clinic offers evaluation, testing and on-site treatment for gonorrhea, syphilis, chlamydia, and all other STDs. It houses a microbiology lab for STAT testing. In addition, the clinic offers STD patients confidential HIV testing, early care for HIV-infected patients, Pre and Post-Exposure Prophylaxis (PEP and PrEP) for prevention of HIV infection, and family planning services for women, including pregnancy testing, Pap smears, and colposcopy.

Patient demographics

- A total of 10,585 patients were seen at City Clinic in 2015. The majority were male (8,044 patients, 75.9 percent), and slightly more than half of male patients identified as gay or bisexual (54.5 percent). Consistently for the past 3 years, approximately 0.5 percent of patients are transgender.
- There were 18,526 patient visits in 2015; 50.3 percent of all visits were among men who identified as gay or bisexual and 1.0 percent of visits were among transgender persons.
- The majority of visits (58.1 percent) were among patients 20 to 34 years old. Only 2.4 percent of visits were among patients under 20 years old.
- Over half (54.6 percent) of visits were among patients who identified as non-white.
- San Francisco residents made up 76.4 percent of visits.

Table 24. Clinic visits by city of residence. Cities with more than 100 visits listed first by frequency of visits; other cities listed alphabetically below. Cities with fewer than two visits in 2015 are included in "other." "Homeless" visits only include patients who do not live primarily in one city.

STDs at City Clinic

- Trends in cases from City Clinic reflected the citywide increases in chlamydia, gonorrhea, and early syphilis, though at a lower rate of change for chlamydia and gonorrhea.
- The prevalence of gonorrhea increased from 6.4 to 7.0 percent, largely the result of the increase among males (from 7.8% to 8.5%).
- In 2015, increases were seen in non-reportable conditions despite having seen decreases in 2014, including trichomoniasis, herpes, and genital warts, and mucopurulent cervicitis (MPC).
- Prevalence of STDs among gay and bisexual male patients and transgender patients was higher than prevalences among women and other male patients. Gay and bisexual male patients had a gonorrhea prevalence of 11.9 percent compared with 7.5 percent for transgender persons, 3.3 for other men, and 1.4 percent for women.

Transgender people*

- This new section of the 2015 report focuses on STDs in transgender people in San Francisco. While these data are very limited, we felt it was important to share what we know now about the sexual health of transgender people. We will also be working in the coming years on efforts to improve the quantity and quality of data that we are able to report.
- We include only data of patients seen at San Francisco City Clinic (SFCC) because of the standardized data collection methods on sexual orientation and gender identity (SOGI) at SFCC and the limited reporting of transgender identity from other providers and laboratories.
 - At SFCC, patients are asked to identify their gender both at the time of registration and again with their clinician. Patients identifying as transgender at either point in their visit are included in this section.
 - The Confidentiality Morbidity Report Form used by providers to inform the health department of reportable diseases currently lists only “male” and “female” as options for patient gender. We are in the process of adding transgender options to the form.
 - Most laboratories receive limited information on SOGI, and so are unable to transmit these data to SFDPH.
- At SFCC:
 - Transgender persons made up 0.6% of the total patients and 1.0% of total visits in 2015.
 - The majority of transgender people and visits were among trans females.
 - Only chlamydia diagnoses were identified during visits by trans males or trans people whose specific gender identity was unknown, but visits by trans females led to the identification of all 3 major STDs: gonorrhea (9.0% of visits), chlamydia (6.6% of visits), and syphilis (5.7% of visits).
 - In all cases, the proportion of visits during which an STD was diagnosed was much higher among transgender persons than for cis males or cis females.
 - A very high proportion of trans patients whose specific gender identity was unknown self-reported being HIV positive (46.2%) during their 2015 visit to SFCC, followed by trans females (15.9%), which was comparable to known or self-reported HIV positivity among cis males seen at SFCC (18.9%). Few new HIV infections were diagnosed at SFCC in 2015 except among cis males.
- Ongoing efforts to improve the quality and quantity of STD data for transgender people include: (1) revising the SFDPH Confidential Morbidity Report Form to include additional SOGI data, (2) reviewing protocols for collecting SOGI at City Clinic to serve as best practices guides, and (3) participating in SOGI discussions with SFHN during planning for the new SFDPH enterprise electronic health record.

*** Terminology Defined:**

Transgender: A person whose gender identity differs from the sex that was assigned at birth. May be abbreviated to trans. A **transgender man** (or **trans male**) is someone with a male gender identity and a female birth assigned sex; a **transgender woman** (or **trans female**) is someone with a female gender identity and a male birth assigned sex. A **non-transgender person** may be referred to as **cisgender** (cis=same side in Latin).

HIV testing

Voluntary, confidential, same-day HIV testing is available to City Clinic patients at no additional cost. Since 2004 high-risk patients with negative HIV antibody results are also tested for HIV pooled viral load to identify acute HIV infections.

- In 2015, the vast majority (93.8%) of new HIV infections were identified among the MSM Not IDU risk group.
- The number of patients tested for HIV at City Clinic increased 6.3 percent, from 6045 in 2014 to 6427 in 2015. The number of positive tests increased from 57 to 65. Only 1.0 percent of tests were positive, which was tied with 2014 for the lowest positivity rate since 2009.
 - There were 34 new positives for San Francisco residents among the 65 HIV diagnoses identified at City Clinic. This represents 13.3 percent of the 255 new HIV diagnoses in San Francisco in 2015.*
- Since these HIV data only represent persons who chose to be tested at City Clinic, and because testing criteria have changed over time, the prevalence measured over time may not represent prevalence and incidence in the greater population of San Francisco residents.
- In 2015 most patients tested for HIV with the rapid test were also tested with the fourth-generation antibody test at the DPH laboratory. For this reason it was not possible to categorize testing patients as "rapid" or "standard" and compare rates as we have done in previous years.
